

Jing-Zhang Urban Weave

A Centennial Public Innovation Belt for AI

English companion drawing package | Agent: iMUYU Urban Agent | GitHub: DAmin777

PROVISIONAL INTAKE PACKAGE

This companion is an English display layer. The structured GeoJSON, metrics, matrices, and self-check remain the evidence basis. Current boundaries are not official redlines, exact-area evidence, regulatory-plan controls, or engineering conclusions.

01 | Concept and scope

The proposal translates the memory of the Jing-Zhang Railway into an updateable public innovation network.

One memory spine connects history and innovation. Three stations carry research, co-creation, and application. Two wings connect technology services to everyday life. Multiple stitches connect campus, community, industry, and blue-green interfaces.

Coordinating research scope: about 43.6 km². Overall design scope: about 11.4 km². Key-area scope: about 3.684 km². These are announcement working scales; official polygons are not yet available.

Replacement rule: when official polygons arrive, retain the provisional version for audit, recalculate every linked layer and metric, and synchronize the status in proposal, HTML, drawings, and matrices.

02 | Three stations and two wings

Zhongzhiyuan Autonomous Innovation Station: northern research, standards, safety, and professional services in a garden-like innovation setting.

AI Origin Co-creation Station: central near-campus and near-community learning, prototyping, public display, and feedback.

Dazhongsi Application-Transfer Station: southern agents, intelligent terminals, professional services, and public observation of urban applications.

Zhongguancun technology-service wing: research, entrepreneurship, legal, compute, and technical interfaces.

Xiaoyuehe everyday-scenario wing: everyday life, education, health, exercise, and community services along the blue-green edge.

03 | AI scenes and public value

The package contains ten scenario cards and six personas. Each card specifies users, a spatial node, a trigger, an AI role, an operator, human review, a data boundary, an observable output, and a risk.

Priority industry tests: Open-Source School - one class to one prototype; Dazhongsi Application Showcase - from model to neighborhood; Standards and Safety Workshop.

Priority public-space tests: Riverbank Lab - let the city breathe; Smart-Life Theater - one route, multiple urban experiences; Blue-green microclimate observatory.

Cultural and civic tests: Jing-Zhang Memory Compiler; Community Care Wayfinding Desk; Campus-park shared-time scheduling; International developer community translation desk.

AI does not perform facial recognition, infer sensitive attributes, conduct automated enforcement, or replace medical, legal, planning, heritage, transport, or engineering judgment.

04 | Renewal and phasing

P0 Evidence organization: boundary replacement, field survey, and heritage, transport, and municipal verification.

P1 Lightweight pilots: Open-Source School, Jing-Zhang Memory Compiler, and small Weave Living Room co-creation.

P2 Public interfaces: Riverbank Lab, Trace Gallery, and Smart-Life Theater.

P3 Application transfer: Dazhongsi Application Showcase, City Sandbox, and developer community.

Every phase requires a responsible operator, public or cleared data, human review, a public explanation, a decision gate, observable outputs, and an exit condition. Formal funding, ownership, permissions, and appointments remain unknown + reason.

05 | Public space and cultural narrative

Key public-space nodes are Centennial Echo, Weave Living Room, Open-Source School, City Sandbox, Trace Gallery, and Co-creation Theater.

The cultural narrative is from line to network: the railway connected people, goods, and knowledge; Zhongguancun formed an innovation network; AI places models, data, public space, and human judgment into a reviewable loop.

Heritage facts, images, fonts, and marks require source, version, clearance, and human fact-checking. AI-generated material cannot replace historical verification.

06 | Metrics, risk, and evidence

Current working values include site_area_sqm 11,412,825.386, green_ratio 0.171611, public_space_ratio 0.031909, and three provisional key areas.

These values are traceable for the present geometry iteration. They are not official area confirmation or statutory controls. FAR, height, density, road redlines, ownership, capacity, investment, recruitment, policy, and operator appointment remain unknown + reason.

The five technical figures, nine GeoJSON layers, metrics, assumptions, compliance matrix, standard matrix, design-depth matrix, and self-check form one auditable evidence chain.

07 | Copyright and review boundary

Only registered public or cleared sources are used. Personal privacy, internal data, uncleared images, unauthorized enterprise marks, and unauthorized fonts are excluded.

Temporary polygons are used for concept generation, display, discussion, and self-check only. Spatial suggestions are conceptual proposals, reference schemes, or material for professional deepening.

Every scenario has human review, traceable versions, public explanation, complaint routing, pause conditions, and an exit mode. Human professional teams retain final veto power for safety, heritage, public resources, minors, accessibility, personal data, and external publication.
