

LIVE • JZ: Fifteen-Minute Living Loop (Concept)

A0 Board 1/2 - Overall Concept & Spatial Structure

Official scope hierarchy (announcement text)

Coordinated research area approx. 43.6 km2
Overall design area approx. 11.4 km2
Key areas approx. 368.4 ha
Sub-scope: 15-minute life circle & community service network (concept)

Structure: one axis, three centres, network of points

Concept slow-traffic spine (along the Jing-Zhang Heritage Park) links the 15-min service hub (Zhongzhiyuan), micro station (AI Origin Community) and community living room (Dazhongsi); embedded micro points follow facility inspection.

Core metrics (participant provisional model data)

site_area_sqm approx. 11,412,825 m2
green_ratio approx. 0.129
public_space_ratio approx. 0.0045
(recomputed from provisional geometry; recalculate when official data is published)

Overall Design Overview: One Axis, Three Centres, Network of Points (provisional)

Legend

- Research 25%
- Residential 18%
- Commercial 16%
- Business & finance 9%
- Community service facilities 9%
- Cultural 7%
- Park & green 7%
- Medical & health 4%
- Sports 4%
- Level-1 slow-traffic spine (green belt)

Scope: overall design area approx. 11.4 km2
(announcement text; provisional drawing here).

Structure: one axis links three centres, network of points - the concept slow-traffic spine along the Jing-Zhang Heritage Park links the three nodes and extends to rail connections; embedded micro points follow facility inspection.

Nodes: 15-min Service Hub (Zhongzhiyuan), Micro Service Station (AI Origin Community), Community Living Room (Dazhongsi).

Key areas (approx. 368.4 ha concept) shown dashed; full recomputation when official geometry is published.

Land Use, Scenarios & Indicators (Concept)

AI scenario cards (12) and test-and-validate scenarios (3)

C01-C12: guide / scheduling / elderly-accessibility / matching / feedback / inspection / emergency - all anonymised aggregation + human review + non-AI equivalent channels; T1-T3 give falsifiable hypotheses, data input, model boundaries, sandbox processes, acceptance indicators, exit thresholds and supplier types. Data lifecycle controls (collection/use/retention/sharing/deletion/fairness review/complaints & incident response) are implemented card by card.

Indicators (formula / confidence / recompute trigger)

$green_ratio = green\ area / overall\ design\ area$ (low confidence; recompute when official geometry is published)
 $public_space_ratio = public\ space\ area / overall\ design\ area$ (low confidence; same)
 $global_case_count=8 \cdot annual_program_count=4 \cdot persona_count=6 \cdot industry_test_scenario_count=3$ (high confidence; visible table counts)

Land-Use Structure (single caliber: 9 main classes + road, provisional)
